## Iron(II) sulfate heptahydrate (Ferrum sulfuricum)

# FeS04.74+20

### **M = 278,01**

Iron(II) sulfate heptahydrate forms green, weathering crystals with a density of 1.9 g/cm<sup>3</sup>, melts at 64°C during heating. Heated above 100°C, it becomes salt monohydrate. Anhydrous iron(II) sulfate can only be obtained when heated at 250-300°C. In air, iron(II) sulfate is easily oxidized to brown iron(III) sulfate Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>. Acidified FeSO<sub>4</sub> solutions are easily oxidized by such oxidants as H<sub>2</sub>O<sub>2</sub>, KMnO<sub>4</sub>, K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and others according to e.g. reaction:

10 FeSO<sub>4</sub> + 2 KMnO<sub>4</sub> + 8 H<sub>2</sub>SO<sub>4</sub>  $\longrightarrow$  5 Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> + 2 MnSO<sub>4</sub> + K<sub>2</sub>SO<sub>4</sub> + 8 H<sub>2</sub>O

This reaction is used in chemical analysis for the quantitative determination of iron.

Iron(II) sulfate is obtained also by treating metallic iron with sulfuric acid according to the reaction equation:

 $Fe + H_2SO_4 \longrightarrow FeSO_4 + H_2$ 

#### **Realisation:**

As a raw material, you can use thin wire, small nails or iron filings, from which FeSO<sub>4</sub> can be obtained under the action of dilute sulfuric acid. Dry the resulting salt at 50°C, then weigh and calculate the process efficiency.

#### Equipment:

- Beakers: 100-150 cm<sup>3</sup>,
- Graduated cylinder for 50 cm<sup>3</sup>,
- · Glass Buchner Funnel,
- · Vacuum desiccator,
- Filtration set,
- Stirring rod,
- Test tubes.

#### **Reagents:**

- Iron (thin wire, small nails, filings) 10 g,
- · Sulfuric acid  $2M H_2SO_4 100 \text{ cm}^3$ ,
- Methanol or ethanol  $-50 \text{ cm}^3$ .
